

Like every British aircraft . . .

The Argosy flies with
Ward, Brooke components

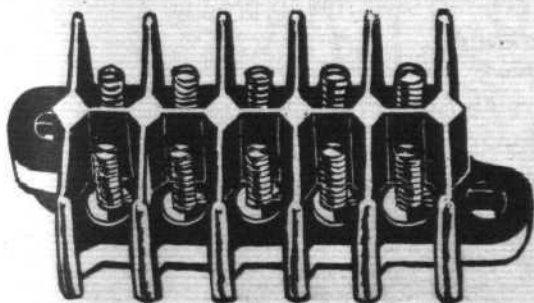

Plastic electrical components, manufactured to the highest standards by Ward, Brooke of High Wycombe, have once again been specified for a British aircraft—this time the Gloster-Whitworth Argosy.

The Argosy employs Ward, Brooke terminal blocks, sleeveings, conduits and straps which, together with many other plastic items, contribute to the efficiency of this fine aircraft.

The range of Ward, Brooke components includes terminal blocks up to 20 way, single or double row with non-corrodible studs and unbreakable plastic mouldings. These blocks accept up to 8 ring terminated conductors per stud. They are proofed against rotational shorting and accept inter-terminal linking strips and optional covers. There is a choice of BA or UN threads, panel mounting, through and shrouded patterns. Plus six colours and numbered terminals.

Send for details of the range of Ward, Brooke components to Sales Department.
