

TRENT 900

TRENT 800

TRENT 700

More payload, more miles, more income – the fundamental demands of every airline for the future, but which is the best choice of engine to deliver these?

The reasons for choosing the Rolls-Royce Trent are equally fundamental. The Trent 700 is already successfully powering the Airbus A330, the Trent 800 is demonstrating its superiority on the Boeing 777. And while the scheduled arrival of the new high-capacity four engine wide body aircraft will present a challenge, the Trent 900 is already waiting in the wings, well ahead of the competition.

All the Trent engines are designed and developed around the Rolls-Royce unique three-shaft engine concept, proven technology that gives low weight and high thrust, together with low operating costs.

With all the shared advantages of a family of engines, whatever your future demands, the Trent is the low risk, high revenue-earning choice for the 21st century.
