

THE 30 BEST REASONS FOR CHOOSING THE TRENT 800

Take a seat and consider the facts.

On a Boeing 777 the Trent 892 engine is approximately 5,300lb lighter than the PW4090 and approximately 7,200lb lighter per aircraft than the GE90-90B. This advantage can equate to 30 additional passengers each flight. Evaluate that over the life cycle of the engine and the airframe, and the extra revenue generation for an airline is potentially millions of dollars.

No other engine in its class can match this, because no other engine has the Trent's unique three shaft design – proven technology that makes the engine significantly lighter and able to deliver higher thrust than its competitors.

For all these reasons, choose the Trent and you can sit back and relax, confident in the knowledge that there is no better engine to take your airline into the 21st century.
