

## *The "Golden Hind" Sails Again*

### **13 TONS OF 'ALCLAD' ALUMINIUM ALLOY FOR BRITAIN'S LARGEST FLYING BOAT**

Exactly 362 years ago the *Golden Hind* sailed the sea routes. Since the days when tiny ships sailed into the unknown, scientific research has carried progress to the point when the making of history is almost assured before the attempt. Always we have realised this, and in our endeavour to keep abreast of the rapid development of the aircraft industry, we have increased our already large research and manufacturing facilities in such a manner that, as the

largest suppliers to the industry, we are fully confident of meeting the demands of the greater aircraft industry which is arising today. We are proud to say that 13 tons of 'Noral' aluminium were incorporated in this 31½ ton Imperial Airways giant flying boat, constructed by Short Bros. (Rochester and Bedford) Ltd., consisting of Alclad NA.24S to DTD.275, Alclad NA.23S to DTD.390 and NA.293 to DTD.293 extruded sections.
