

PERFECT CO-ORDINATION . . .

Out over enemy targets, British bombers make good use of favourable weather conditions forecast for them by the "weather people" at home. Instruments bear the brunt of these delicate calculations. Without them, meteorological science could not continue to function. Thanks to instruments, nothing need ever be left to chance. The Pullin organisation

has been making scientific instruments long enough to know the part they play in careful planning and exact deduction. They explore in advance every possibility which has a bearing upon the objective to be reached. That is why Pullin precision succeeds in finding a solution to the problem where less exacting methods would be of little avail.

METEOROLOGICAL SURVEY—With the help of delicate instruments, a specially trained section of the R.A.F. carries out the task of forecasting weather conditions over given areas. Upon the result of their deductions depends the successful outcome of every important air operation.
