*perfect
formation*

Perfect formation is the keynote of the high precision miniature bearings made by the British Manufactured Bearings Company. Sizes available in our comprehensive range run from 1 m.m. to .2500 Bore.

Most types can be supplied either in stainless steel or high carbon chrome. Instrument bearings to 5p and ABEC 7 specifications are manufactured from Vacuum Arc remelted stainless steel.

Recent development and research has resulted in entirely new ranges of sealed bearings and special retainers in phenolic synthetics. The B.M.B. Research Department is equipped to advise customers on the use of dry lubricants and special materials for bearings required to operate in high vacuum conditions.

B.M.B. also offer a wide range of high precision stainless steel and Chrome Alloy balls. Sizes from $\frac{1}{32}$ — $\frac{5}{16}$ inch and 0.5—7.0 metric.

Our modern factory includes a suite of Clean Air rooms, the latest of these being a "Bassaire" "Laminair" Flow room. The Company believe they are the first in the world to assemble high precision bearings under laminar flow conditions; part of the new techniques to meet the stringent specifications required in the aero industry throughout the world.
