The power behind the Powers

Here are some of the more important military aircraft powered by Rolls-Royce engines. Rolls-Royce provides turbine power for more than 60 types of aircraft, flown by over 100 air forces, a record no one else in the world can match. Engines like the Adour, Spey, Tyne, Gem, Odin, Pegasus and Viper offer not just efficiency, reliability and fuel economy, but great versatility. They, and others, power everything from jump jets and long-range transports to supersonic fighters and rescue helicopters, from bombers to missile systems. Rolls-Royce military engines now account for more than half the company's business. Our capability to work with other companies worldwide on engine design, development and manufacture, and to arrange the best match between engines and airframes, is a key factor in this success story.
